Learning beyond the network

ASTAR is an offline-first education initiative combining a learning platform, content-preparation tools and proposed solar-powered hardware.

01 ASTAR learning platform

Students navigate chapters and lessons, read text and monochrome diagrams, practise with teacher-authored questions and resume locally saved progress.

02 ASTAR Forge / content preparation

The existing textbook studio extracts and organises PDF content, flags conversion issues for review, and exports portable learning packages and standalone HTML readers.

03 Proposed ASTAR device

A compact device with an e-paper display, physical controls, local content storage, rechargeable battery and solar charging. Components, power budget and enclosure remain to be validated.

04 Intended deployment

Students aged 10-18 in disrupted or underserved learning settings. The proposed route is through education organisations, humanitarian teams and institutional pilots.

Development and commercial targets

Software prototype exists. Hardware is proposed. Founder estimates: INR 3,700 unit cost and INR 4,700 institutional selling price. These are unvalidated targets, not supplier quotes or final prices.

Seeking technical mentors and pilot-design collaborators
